

**W78C31B**

## **8-BIT MICROCONTROLLER**

### **GENERAL DESCRIPTION**

The W78C31B microcontroller supplies a wider frequency range than most 8-bit microcontrollers on the market. It is compatible with the industry standard 80C31 microcontroller series.

The W78C31B contains four 8-bit bidirectional parallel ports, two 16-bit timer/counters, and a serial port. These peripherals are supported by a five-source, two-level interrupt capability. There are 12 bytes of RAM, and the device supports ROMless operation for application programs.

The W78C31B microcontroller has two power reduction modes, idle mode and power-down mode, both of which are software selectable. The idle mode turns off the processor clock but allows for continued peripheral operation. The power-down mode stops the crystal oscillator for minimum power consumption. The external clock can be stopped at any time and in any state without affecting the processor.

### **FEATURES**

- 8-bit CMOS microcontroller
- Fully static design
- Low standby current at full supply voltage
- DC-40 MHz operation
- 128 bytes of on-chip scratchpad RAM
- ROMless operation
- 64K bytes program memory address space
- 64K bytes data memory address space
- Four 8-bit bidirectional ports
- Two 16-bit timer/counters
- One full duplex serial port
- Boolean processor
- Five-source, two-level interrupt capability
- Built-in power management
- Packages:
  - DIP 40: W78C31B-16/24/33/40
  - PLCC 44: W78C31BP-16/24/33/40
  - QFP 44: W78C31BF-16/24/33/40

### 44-Pin QFP (W78C31BF)

**PIN DESCRIPTION**

**P0.0–P0.7**

Port 0, Bits 0 through 7. Port 0 is a bidirectional I/O port. This port also provides a multiplexed I/O address/data bus during accesses to external memory.

**P1.0–P1.7**

Port 1, Bits 0 through 7. Port 1 is a bidirectional I/O port with internal pull-ups.

**P2.0–P2.7**

Port 2, Bits 0 through 7. Port 2 is a bidirectional I/O port with internal pull-ups. This port also provides the upper address bits for accesses to external memory.

**P3.0–P3.7**

Port 3, Bits 0 through 7. Port 3 is a bidirectional I/O port with internal pull-ups. All bits have alternate functions, which are described below:

PIN	ALTERNATE FUNCTION
P3.0	RXD Serial Receive Data
P3.1	TXD Serial Transmit Data
P3.2	$\overline{\text{INT0}}$ External Interrupt 0
P3.3	$\overline{\text{INT1}}$ External Interrupt 1
P3.4	T0 Timer 0 Input
P3.5	T1 Timer 1 Input
P3.6	$\overline{\text{WR}}$ Data Write Strobe
P3.7	$\overline{\text{RD}}$ Data Read Strobe

$\overline{\text{EA}}$

External Address Input, active low. This pin forces the processor to execute out of external ROM. This pin should be kept low for all W78C31B operations.

RST

Reset Input, active high. This pin resets the processor. It must be kept high for at least two machine cycles in order to be recognized by the processor.

ALE

Address Latch Enable Output, active high. ALE is used to enable the address latch that separates the address from the data on Port 0. ALE runs at 1/6th of the oscillator frequency. A single ALE pulse is skipped during external data memory accesses. ALE goes to a high state during reset with a weak pull-up.

**PSEN**

Program Store Enable Output, active low.  $\overline{\text{PSEN}}$  enables the external ROM onto the Port 0 address/data bus during fetch and MOVC operations. PSEN goes to a high state during reset with a weak pull-up.

**XTAL1**

Crystal 1. This is the crystal oscillator input. This pin may be driven by an external clock.

**XTAL2**

Crystal 2. This is the crystal oscillator output. It is the inversion of XTAL1.

**VSS, VCC**

Power Supplies. These are the chip ground and positive supplies.

## FUNCTION DESCRIPTION

The W78C31B architecture consists of a core controller surrounded by various registers, four general purpose I/O ports, 128 bytes of RAM, two timer/counters, and a serial port. The processor supports 111 different instructions and references both a 64K program address space and a 64K data storage space.

### Timers 0, 1

Timers 0, 1, each consist of two 8-bit data registers. These are called TL0 and TH0 for Timer 0, TL1 and TH1 for Timer 1. The TCON and TMOD registers provide control functions for timers 0, 1.

### Clock

The W78C31B is designed to be used with either a crystal oscillator or an external clock. Internally, the clock is divided by two before it is used. This makes the W78C31B relatively insensitive to duty cycle variations in the clock.

### Crystal Oscillator

The W78C31B incorporates a built-in crystal oscillator. To make the oscillator work, a crystal must be connected across pins XTAL1 and XTAL2. In addition, a load capacitor must be connected from each pin to ground, and a resistor must also be connected from XTAL1 to XTAL2 to provide a DC bias when the crystal frequency is above 24 MHz.

### External Clock

An external clock should be connected to pin XTAL1. Pin XTAL2 should be left unconnected. The XTAL1 input is a CMOS-type input, as required by the crystal oscillator. As a result, the external clock signal should have an input one level of greater than 3.5 volts.

## Power Management

### Idle Mode

The idle mode is entered by setting the IDL bit in the PCON register. In the idle mode, the internal clock to the processor is stopped. The peripherals and the interrupt logic continue to be clocked. The processor will exit idle mode when either an interrupt or a reset occurs.

### Power-Down Mode

When the PD bit of the PCON register is set, the processor enters the power-down mode. In this mode all of the clocks, including the oscillator are stopped. The only way to exit power-down mode is by a reset.

### Reset

The external RESET signal is sampled at S5P2. To take effect, it must be held high for at least two machine cycles while the oscillator is running.

# W78C31B

An internal trigger circuit in the reset line is used to deglitch the reset line when the W78C31B is used with an external RC network. The reset logic also has a special glitch removal circuit that ignores glitches on the reset line.

During reset, the ports are initialized to FFH, the stack pointer to 07H, PCON (with the exception of bit 4) to 00H, and all of the other SFR registers except SBUF to 00H. SBUF is not reset.

Notes:

- \*1. P0 and P2 are in external access mode.
- \*2. RST pin has an internal pull-down resistor of about 300K
- \*3. XTAL1 is a CMOS input and RST is a Schmitt trigger input.

**AC CHARACTERISTICS**

The AC specifications are a function of the particular process used to manufacture the part, the ratings of the I/O buffers, the capacitive load, and the internal routing capacitance. Most of the specifications can be expressed in terms of multiple input clock periods (TCP), and actual parts will usually experience less than a \*\*20 nS variation. The numbers below represent the performance expected from a 1.2 micron CMOS process when using 2 and 4 mA output buffers.

Clock High	T <sub>CH</sub>	10	-	-	nS	3
Clock Low	T <sub>CL</sub>	10	-	-	nS	3

Notes:

- 1. The clock may be stopped indefinitely in either state.
- 2. The T<sub>C</sub>P specification is used as a reference in other specifications.
- 3. There are no duty cycle requirements on the XTAL1 input.
